Dismantling the lower housing surrounding the diaphragm and the several connecting pipes looks pretty tricky without some guidance. I dont need to dismantle the whole thing, just the lower section under the water flow adjustment knob. If I can get it apart and it is only a rubber diaphragm that needs replacing then I can do it. If its anything else it will mean a plumber and probably a whole new HWS which is fine but I want to try the simple DIY fix first.

Installation should be pretty straightforward and the manuals not that in depth. There are however some sections on adjusting the gas and the like that you might want to read over. Login to post Now if needed clean over the whole unit with compressed air to spruce it up and reduce fire hazard or if your diy then its nice to clean things before working on them imo. Dont ask me what all that would cost. You dont need to mess round with the gas side thats all fine. Now heres what you do to fix em, this is for a Bosch Hydropower 10H but I assume it probably applies to the other hydropower models too. We'll take you through step by step on how to easily relight Bosch hot water system, especially Bosch 10P. This allows the gas through to the pilot light. If it doesn't light, something has blocked up the injector and it needs a service. If it goes out immediately, it needs a service. This allows gas to go through to the main burner when the water is turned on. Hot water should start coming through. If it doesn't, it means the diaphragm has perished and it will need to be replaced. They have new ones made of silicone which are awesome. Check if there's any leak. The most important part that needs to be replaced is the gland sleeve. It is located between the gas chamber and the water chamber. If you do get water into the gas chamber, you will be up for a new hot water system. That's why this is important to keep an eye out for. Sometimes it may not have entered the gas chamber yet, but when there's water dripping onto the gland sleeve, over time it will stuff it up and it will need replacement. If you leave it for too long, you won't be able to service the hot water system anymore. Now, before we adjust the temperature of the water, here's something you should know. Therefore, the slower the water travels through the HWS, the more heat it will collect. Turn it anticlockwise. This will allow the water to flow through the unit as fast as possible. It's great in the summer time as the water is slightly warmer flowing into the unit. Your information will not be shared nor sold. Your information will not be shared nor sold. The heating element is covered under warranty for a period of five years. All other parts are covered under a one year warranty. If the tankless water heater develops a problem, troubleshoot it before calling for service. Disconnect the power supply to the water heater before removing the cover. Connect the supply line to the blue inlet on the water heater. Push the reset button in the center of the cutout. Reconnect the power. The switch activates when hot water is turned on. If the switch does not activate, call for service. Open the cover and turn the screw counterclockwise to loosen it. Pipe joints should not be sealed with plumbers glue. This can reduce the flow of water. Turn counterclockwise to open fully. Turn the hot water faucet on in a nearby sink. If there is a steady stream of water, the cold water is flowing into the hot water lines. Call a plumber to repair the

crossover between hot and cold water lines. Please note that depending on the settings you choose, the full functionality of the website may no longer be available.
