Prasanna Kumar 5.0 out of 5 stars The quality is good. The settings it provides meets our day today purpose. Demo installation done on the next day at erode. Previously had Samsung compare to that performance also good. Consthe demo person mostly concentrate on extended warranty which costs 2500. For that he gave information which really shocking. He told us in case of repair the labour cost also Rs 650 with gst. It may be increased. Spare parts are more costly like 4000. So better go with extended warranty that we need to finalise on same day. People who are all planning to buy consider it. During demo person more talking about issues. Does that mean bosch product wont work after two years. Reputed company need to consider customer burden also.

Charge nominal give your best so that we can continue the relationship with bosch in future too. Therefore, they cannot provide service for this machine. It seems Amazon provided this machine from an unauthorised shop. Options are aplenty which is confusing at times even though the installation engineer explained it very nicely. Good washing, good drying at the basic level. You still need to hang the clothes for drying. Ill recommend it to people on budget. Feels good and build quality is sturdy. A better option than Samsung or LG or IFB or Whirlpool. Washing machine was not working 1 month also not over this thing is happened replace or refund my amount. Received the product on 12 Oct 2018. The technicians contact details are mailed to you by Amazon. It will beep when everything is done and automatically switches off the machine. All you have to do is to switch off the main power where the power cord is connected. But it is Made in China Product. Amazons delivery time was from 800 AM to 200 PM. Delivered at 812 AM itself. So. Wonderful Job done by Amazon. The Delivery person too handed over nicely. Didnt ask for any tips or expectations. Coming to Product 1. You will not received any sealed product as you get like from Authorized dealers or Retailers. I got only with later. 2. This product is Chinese Made. So people who are looking only for Made in India can go for LG, IFB, Whirlpool, Onida, BPL or Godrej Still you should confirm depending upon model to Model. Top Load is fully made in China. Front load is only Assembled in India Chennai. 3. How will get assistance on installation and Warranty. About Warranty This product was delivered by Clouddtail retailer which is big merchant of Amazon. You will get the invoice copy, but there you wont find any serial number matching with it on the product which qualifies for its genuineness of not being used by anyone or a returned product has been delivered to you. You need to call to Bosch Help Line Number 18002661880.

<http://aquaer.com/images/canon-sure-shot-z135-manual.pdf>

Just follow the instruction. Installation The Engineer will visit. He will take picture of your Invoice and unique Serial Number on the machine and upload it on the server. So by this way, you can claim or register your warranty. He will describe everything to you. The Engineer will contact you, before visiting and ask if you need additional additives like extra Hose pipe, stand, cover, etc. 4. The Working of washing mashing is fine. Cleans the Cloth nicely, but if there are tough stains, I would practically suggest you to rub or clean those with your hands on particular spots before you put it in WM for cleaning. 78 Cloths for daily wash is good to put in. More than that will not get such good result. One Touch feature works good. Handling and operating the WM is very easy once the Engineer briefs you. However the tub may collide with the exterior walls of the WM on the rear side

thus making woeful sound or disturbance. You need to adjust the leveling accordingly. If you see minutely, there are 3 sponges being provided front, left and right inside the WM. You can find at the level of the tub outer to it which helps in avoiding the noise. Will click image and upload for you for better clarity. You may ask Engineer to add one more sponge to the back side too. If you still have any queries, can ask me. For the Sonic Youth album, see Washing Machine album. The term is mostly applied to machines that use water as opposed to dry cleaning which uses alternative cleaning fluids and is performed by specialist businesses or ultrasonic cleaners. The user adds laundry detergent, which is sold in liquid or powder form, to the wash water. That made the warm soapy water precious; it would be reused, first to wash the least soiled clothing, then to wash progressively dirtier laundry. First, soap would be rinsed out with clear water. After rinsing, the soaking wet clothing would be formed into a roll and twisted by hand to extract water. The entire process often occupied an entire day of hard work, plus drying and ironing. Basically, these early design patents consisted of a drum washer that was handcranked to make the wooden drums rotate. Because of the Patent Office fire in 1836, no description of the device survives. However, high unemployment rates in the Depression years reduced sales; by 1932 the number of units shipped was down to about 600,000. Patrons used coin-in-the-slot facilities to rent washing machines.

The mechanism was now enclosed within a cabinet, and more attention was paid to electrical and mechanical safety. In appearance and mechanical detail, this first machine was not unlike the front loading automatic washers produced today. Because of the components required, the machine was also very expensive. For instance, the Bendix Home Laundry Service Manual published November 1, 1946 shows that the drum speed change was facilitated by a 2-speed gearbox built to a heavy duty standard not unlike a car automatic gearbox, albeit at a smaller size. The timer was also probably fairly costly, because miniature electric motors were expensive to produce. Later, permanent connections to both the hot and cold water supplies became the norm, as dedicated laundry water hookups became common. September 2016 Learn how and when to remove this template message However, numerous US appliance manufacturers were given permission to undertake the research and development of washers during the war years. General Electric also introduced its first top loading automatic model in 1947. This machine had many of the features that are incorporated

into modern machines. Another early form of automatic washing machine manufactured by The Hoover Company used cartridges to program different wash cycles. The cartridge was inserted into a slot on the machine and a mechanical reader operated the machine accordingly. Electromechanical timers consist of a series of cams on a common shaft driven by a small electric motor via a reduction gearbox. At the appropriate time in the wash cycle, each cam actuates a switch to engage or disengage a particular part of the machinery for example, the drain pump motor. One of the first was invented in 1957 by Winston L. Shelton and Gresham N. Jennings, then both General Electric engineers.

However, by the 1950s demand for greater flexibility in the wash cycle led to the introduction of more sophisticated electrical timers to supplement the electromechanical timer. These newer timers enabled greater variation in functions such as the wash time. With this arrangement, the electric timer motor is periodically switched off to permit the clothing to soak, and is only reenergized just prior to a microswitch being engaged or disengaged for the next stage of the process. Fully electronic timers did not become widespread until decades later. This was largely because of the economic impact of World War II on the consumer market, which did not properly recover until the late 1950s. The early electric washers were singletub, wringertype machines, as fully automatic washing machines were extremely expensive. During the 1960s, twin tub machines briefly became very popular, helped by the low price of the Roll's Razor washers. Some machines had the ability to pump used wash water into a separate tub for temporary storage, and to later pump it back for reuse. This was done not to save water or soap, but because heated water was expensive and timeconsuming to produce. Automatic washing machines did not become dominant in the UK until well into the 1970s and by then were almost exclusively of the frontloader design. However, since the 1970s electronic control of motor speed has become a common feature on the more expensive models. For instance, expensive gearboxes are no longer required, since motor speed can be controlled electronically. This makes changing the main bearings difficult, as the plastic drum usually cannot be separated into two halves to enable the inner drum to be removed to gain access to the bearing. It was invented by LG Electronics in 1998 and patents were granted in the US in 2010. Since, other manufacturers have followed suit. Some washing machines with this type of motor now come with 10 warranties.

The direct drive motor's rotor is outside the stator as this provides a slim motor with speed reduction and torque multiplication. The rotor is connected to the inner tub through its center. It can be made out of metal or plastic. Some US companies are working on developing new spin technology to wash clothes faster and more efficiently. Lightning Clean is one of these companies. They are producing the first 10minute washing machine. For example LG's approach involves a phone receiving signals through sound tones, while Samsung's approach involves having the user take a photo of the washers time display with his or her phone. This started a laundry revolution in Canada. As Canadians started to buy front load washers vs top load. These proved reliable and costeffective, so many cheaper machines now also incorporate microcontrollers rather than electromechanical timers. The hexagonal tub spins like a frontloading machine, using only about one third as much water as conventional toploaders. This factor has led to an Energy Star rating for its high efficiency. This washing machine uses a computercontrolled system to determine certain factors such as load size and automatically adjusts the wash cycle to match. The SmartDrive also included direct drive brushless DC electric motor, which simplified the bowl and agitator drive by doing away with the need for a gearbox system. It was claimed that this design reduced the wash time and produced cleaner washing than a single cylinder machine. In 2004 there was the launch of the CR02, which was the first washing machine to gain the British Allergy Foundation Seal of Approval. However, neither of the ContraRotator machines are now in production as they were too expensive to manufacture. A washplate in the bottom of the tub nutated a special wobbling motion to bounce, shake, and toss the laundry around. Simultaneously, water containing detergent was sprayed on to

the laundry.

The machine proved to be good at cleaning, but gained a bad reputation due to frequent breakdowns and destruction of laundry. Instead of an agitator, the machine had two washplates, perpendicular to each other and at a 45 degree angle from the bottom of the tub. Samsung claims this technique reduces cycle times by half and energy consumption by 20%. The pans on the inside of the lid are placed atop the agitator, and wash water is pumped through the perforated pans to collect lint. California This design places the clothes in a vertically mounted perforated basket that is contained within a waterretaining tub, with a finned waterpumping agitator in the center of the bottom of the basket. Clothes are loaded through the top of the machine, which is usually but not always covered with a hinged door. The movement of the agitator pushes water outward between the paddles towards the edge of the tub. The water then moves outward, up the sides of the basket, towards the center, and then down towards the agitator to repeat the process, in a circulation pattern similar to the shape of a torus. The agitator direction is periodically reversed, because continuous motion in one direction would just lead to the water spinning around the basket with the agitator rather than the water being pumped in the torusshaped motion. Some washers supplement the waterpumping action of the agitator with a large rotating screw on the shaft above the agitator, to help move water downwards in the center of the basket. Manufacturers have devised several ways to control the motion of the agitator during wash and rinse separately from the high speed rotation of the drum required for the spin cycle. The action of a frontloading washing machine is better suited to a motor capable of reversing direction with every reversal of the wash basket; a universal motor is noisier, less efficient, doesn't last as long, but is better suited to the task of reversing direction every few seconds.

The impeller design has the advantage of its mechanical simplicity a single speed motor with belt drive is all that is required to drive the Pulsator with no need for gearboxes or complex electrical controls, but has the disadvantage of lower load capacity in relation to tub size. Hoovermatic machines were made mostly in twin tub format for the European market where they competed with Hotpoint's Supermatic line which used the oscillating agitator design until the early 1990s. Some industrial garment testing machines still use the Hoover wash action. Similarly, if the pump motor rotates one way it recirculates the sudsy water; in the other direction it pumps water from the machine during the spin cycle. Mechanically, this system is very simple. During agitation, the transmission converts the rotation into the alternating motion driving the agitator. During the spin cycle, the timer turns on a solenoid which engages a clutch locking the motor's rotation to the wash basket, providing a spin cycle. General Electric's very popular line of FilterFlo seen to the right used a variant of this design where the motor reversed only to pump water out of the machine. In the Whirlpool mechanism, a protruding moving piece oscillates in time with the agitation motion. Two solenoids are mounted to this protruding moving piece, with wires attaching them to the timer. Despite the wires controlling the solenoids being subject to abrasion and broken connections due to their constant motion and the solenoids operating in a damp environment where corrosion could damage them, these machines were surprisingly reliable. The motor reverses direction every few seconds, often with a pause between direction changes, to perform the agitation. Spin cycle is accomplished by engaging a clutch in the transmission. A separate motorized pump is generally used to drain this style of machine.

These machines could easily be implemented with universal motors or more modern DC brushless motors, but older ones tend to use a capacitorstart induction motor with a pause between reversals of agitation. Fabric softener, vinegar, or any other liquid rinse agent, is placed in a cup at the top of the agitator. When the spin cycle is engaged, the fabric softener is pulled up by a tapered cup and centrifugal force, where it collects in the top of the spinning agitator. Once the spin cycle is completed, centrifugal force no longer suspends the fabric softener and it falls through the center of

the agitator to join the rinse water coming into the tub. The same objective must be accomplished by a solenoid valve or a pump, and associated timer controls and wiring, on a front loader. Frontloaders tend to require separate pumps and plumbing to provide lint filters which are often mounted behind covers on the bottom of the machine. Although wet fabric usually fits into a smaller space than dry fabric, a dense wad of fabric can restrict water circulation, resulting in poor soap distribution and incomplete rinsing. Extreme overloading can also push fabrics into the small gap between the underside of the agitator and the bottom of the wash basket, resulting in fabrics wrapped around the agitator shaft, possibly requiring agitator removal to unjam. In addition, most commercial and industrial clothes washers around the world are of the horizontal axis design. The door often but not always contains a transparent window. Agitation is supplied by the backandforth rotation of the cylinder and by gravity. The clothes are lifted up by paddles on the inside wall of the drum and then dropped. This motion flexes the weave of the fabric and forces water and detergent solution through the clothes load. Because the wash action does not require the clothing be freely suspended in water, only enough water is needed to moisten the fabric.

Because less water is required, frontloaders typically use less soap, and the repeated dropping and folding action of the tumbling can easily produce large amounts of foam or suds. A frontloader washer always fills to the same low water level, but a large pile of dry clothing standing in water will soak up the moisture, causing the water level to drop. The washer then refills to maintain the original water level. Because it takes time for this water absorption to occur with a motionless pile of fabric, nearly all frontloaders begin the washing process by slowly tumbling the clothing under the stream of water entering and filling the drum, to rapidly saturate the clothes with water. But frontload washers suffer from their own technical problems, due to the drum lying sideways. For example, a top loading washer keeps water inside the tub merely through the force of gravity pulling down on the water, while a frontloader must tightly seal the door shut with a gasket to prevent water dripping onto the floor during the wash cycle. This access door is locked shut during the entire wash cycle, since opening the door with the machine in use could result in water gushing out onto the floor. For frontloaders without viewing windows on the door, it is possible to accidentally pinch fabric between the door and the drum, resulting in tearing and damage to the pinched clothing during tumbling and spinning. If this bellows assembly were not used, small articles of clothing such as socks could slip out of the wash basket near the door, and fall down the narrow slot between the outer tub and basket, plugging the drain and possibly jamming rotation of the inner basket. Retrieving lost items from between the outer tub and inner basket can require complete disassembly of the front of the washer and pulling out the entire inner wash basket.
